IT Security Audit

The key to understanding
your security exposure.

Can you identify and manage all the risks in your business?

There are many different types of businesses, each with unique priorities, but they all have one thing in common. They face unpredictable, fast-changing risks.

With the rapid increase of cyber threats, and attacks becoming more sophisticated and persuasive, the results can be devastating. Breaches to an organisation's security aren't just costly – they can cause significant damage to company reputation.

With more than 43 per cent of cyber-attacks now targeting small-to-medium sized businesses, can you identify and manage all the risks in your business?

Advanced protection and expert advice is vital in protecting your organisation

TechPath's IT Security Audit goes beyond the industry standards. It is designed to identify and assess vulnerabilities to mitigate the risk of operational disruption, data theft and revenue loss, while securing your intellectual property and protecting your reputation.

IT security is not just about antivirus, firewalls and password complexity – it is also about people. User training is as vital as best practice policies and processes when it comes to ensuring that your technology solutions are working to their full potential.

It is essential that every business knows where they stand when it comes to security, and it pays to have the experts on your side. TechPath simplifies IT security, so you can secure the future of your business.

About TechPath

All kinds of Australian organisations, from many industries, count on TechPath to provide technology solutions that are perfectly aligned to their business needs. No matter how their environments change, customers can trust TechPath to help them to get the most from their technology investment. We draw upon the creativity and expertise of our dedicated, friendly team to custom design boldly innovative solutions, leading to powerful business outcomes.

We review six key areas:

Network security

Server security

Host based security

Physical security

Auditing and compliance

User awareness

'Security vulnerabilities can present huge risks, with the threat of service disruption, data theft, damage to reputation and lost revenue.'

Take the worry out of IT security in your organisation.
